WELLFLOAT®

WELLFLOAT Pegasus II

4-layer "multi-stage pendulum" high-end audio rack

This world's first 4-layer "multi-stage pendulum" high-end audio rack incorporating all the technologies of WELLFLOAT Babel, which became an unprecedented worldwide hit as a top-quality audio insulator, and WELLFLOAT Double, which has been captivating many audio enthusiasts since its release in October last year.

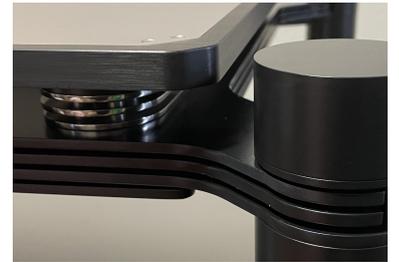

About WELLFLOAT

WELLFLOAT is an exceptional vibration suppression mechanism that uses the same principle of a gravitational wave detector. Its patented "multi-stage pendulum" structure enables it to control vibrations down to the molecular level, which is significantly more effective than other audio insulators sold by different brands.

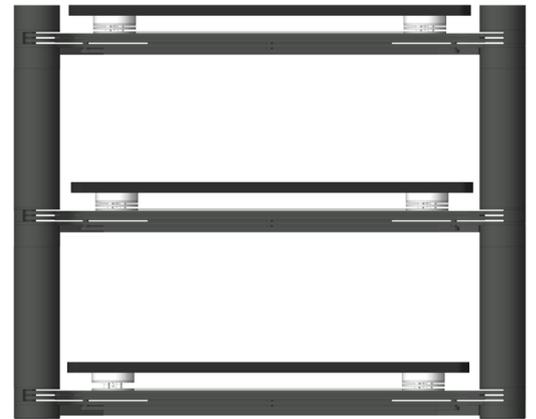

4-layer "multi-stage pendulum" high-end audio rack

■ The board section is made of super-anodized aluminium and sandblasted stainless steel to achieve the ultimate vibration suppression through the synergistic effect of the different materials.

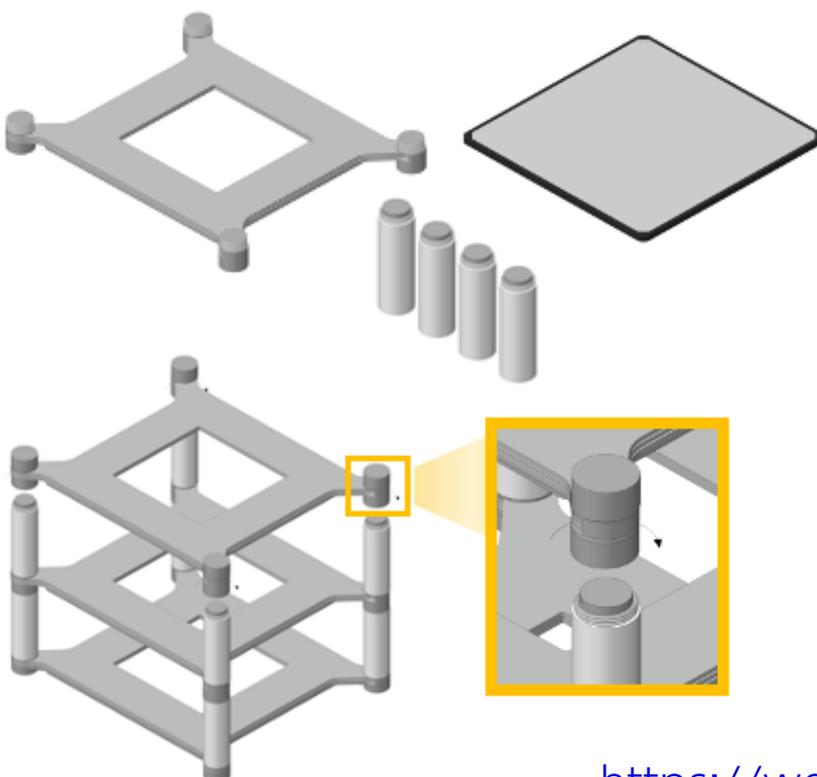

■ The rack shelf's three bottom plates are made of rugged stainless steel, which ensures high rigidity and a low center of gravity.

All of this is done to bring out the full potential of your audio equipment.

Modular configuration

■ On the top of the bottom shelf, the number of tiers can be selected by adding an upper shelf or middle shelf (sold separately).

■ Also, different lengths of posts will be available to change the height between the shelves.

Load capacity per tier: 85kg
